

Our Intentions

We aim to boost the Total Value Locked (TVL) using the Step By Liquidity Boost system. Here's how it works:

We start with an initial liquidity pool of \$50,000 in the TON/OPEN pair. Our strategy involves increasing the size of the pool boost with every \$10,000 increment in the pool size. For instance, as the pool grows to \$60,000, the booster will rise to \$4,000, and when it hits \$70,000, the booster will be \$6,000. This incentivizes users to provide liquidity.

Given that the token primarily serves utility purposes, trading activity will organically drive liquidity growth, as the token is tradable and will be actively bought and sold.

The development of our digital distribution marketplace, supporting payment in OpenCoin, will rapidly drive TVL growth.

Additionally, we will leverage the Open Shield bot to attract liquidity providers by offering incentives for using Open Project services and providing liquidity.
